

Sub  
as  
1 1. A display comprising:

2 a circuit board;

3 a display panel electrically coupled to said  
4 circuit board in face-to-face abutment substantially along  
5 a plane; and

6 an electrical connection including a first  
7 contact on said circuit board, a second contact on said  
8 display panel, and a conductor coupling said first and  
9 second contacts and extending generally along said plane.

1 2. The display of claim 1 wherein said electrical  
2 connection is a surface mount connection including solder  
3 balls.

1 3. The display of claim 2 wherein said solder balls  
2 couple to the contact pads on one of said display panels or  
3 circuit boards.

1 4. The display of claim 3, said display panel  
2 including column electrodes and said conductor including a  
3 metallization coupled to said second contact on said  
4 display panel and extending to a third contact which  
5 contacts a column electrode.

1 5. The display of claim 4 wherein said column  
2 electrode is formed at least in part of indium tin oxide.

1       6.    The display of claim 5 including a plurality of  
2    redundant third contacts to said column electrode.

1       7.    The display of claim 6 including a plurality of  
2    second contacts aligned in a column parallel to said column  
3    electrode.

1       8.    The display of claim 7, said display including  
2    pixels, wherein an electrical connection is made from said  
3    second contacts to said column electrode for every other  
4    pixel along the length of said column electrode.

1       9.    The display of claim 8, said display including an  
2    edge, and including a zone, adjacent to said edge, free of  
3    electrical connections.

1       10.   The display of claim 1 including a row electrode  
2    and a plurality of electrical connections from said second  
3    contacts to the row electrode, said second contacts that  
4    couple to said row electrode being arranged parallel to  
5    said column electrode.

1       11.   A method comprising:  
2           forming an electrical contact pad on a display  
3    panel;

4 forming row and column electrodes on said display  
5 panel; and  
6 electrically coupling a first contact pad to a  
7 row electrode and electrically coupling a second contact  
8 pad to a column electrode, said contact pads being aligned  
9 in the space between two adjacent column electrodes,  
10 extending generally parallel to the length of said column  
11 electrodes.

1 12. The method of claim 11 including using  
2 metallizations to electrically couple said pads to said row  
3 electrodes and said column electrodes.

1 13. The method of claim 11 including providing  
2 redundant electrical connections to said column electrodes.

1 14. The method of claim 11 including excluding  
2 contact pads from a region proximate to the edge of said  
3 display panel.

1 15. The method of claim 14 including providing  
2 contacts to said column electrodes at every other pixel  
3 along the length of said column electrodes.

1        16. The method of claim 15 including avoiding the  
2 contacts to said column electrodes along the edge region of  
3 the panel.

1        17. A display panel comprising:  
2            a substrate;  
3            row and column electrodes formed on said  
4 substrate; and  
5            a plurality of contacts formed between adjacent  
6 row electrodes, a first set of said contacts electrically  
7 coupled to said row electrodes and a second set of said  
8 contacts electrically coupled to said column electrodes.

1        18. The display panel of claim 17 wherein said column  
2 electrodes are formed of indium tin oxide and redundant  
3 electrical connections are made along the length of said  
4 column electrodes.
